

Mobile Communication vs Mobile Computing

Two related concepts: exchanging information and working with information while mobile.

Mobile Communication Exchanging voice, messages and data through wireless links while mobile.		Mobile Computing Using portable devices to process information and run applications while mobile; offline or connected.	
Main focus	Transmission and connectivity between devices.	Main focus	Processing information and running applications.
Key elements	Radio links, base stations and network infrastructure.	Key elements	Portable hardware (phone, tablet, laptop), operating systems and software.
Typical activities	Sending and receiving voice, messages and data.	Typical activities	Creating, editing, storing and processing information.
Connectivity	Needs a wireless link to exchange information.	Connectivity	Can work offline or use wireless connectivity.
Examples	Voice calls, SMS and mobile data transfer.	Examples	Editing a phone document; navigation or field-work apps; offline note-taking.

Communication connects; computing processes. Mobile apps often use both.
